Please refer to the **errata** for this document, which may include some normative corrections.

The English version of this specification is the only normative version. Non-normative translations may also be available.

Abstract

The PROV Ontology (PROV-O) expresses the PROV Data Model [*PROV-DM*] using the OWL2 Web Ontology Language (OWL2) [*OWL2-OVERVIEW*]. It provides a set of classes, properties, and restrictions that can be used to represent and interchange provenance information generated in different systems and under different contexts. It can also be specialized to create new classes and properties to model provenance information for different applications and domains. The PROV Document Overview describes the overall state of PROV, and should be read before other PROV documents.

The namespace for all PROV-O terms is http://www.w3.org/ns/prov#.

The OWL encoding of the PROV Ontology is available here.

Status of This Document

This section describes the status of this document at the time of its publication. Other documents may supersede this document. A list of current W3C publications and the latest revision of this technical report can be found in the W3C technical reports index at http://www.w3.org/TR/.

PROV Family of Documents

This document is part of the PROV family of documents, a set of documents defining various aspects that are necessary to achieve the vision of inter-operable interchange of provenance information in heterogeneous environments such as the Web. These documents are listed below. Please consult the [*PROV-OVERVIEW*] for a guide to reading these documents.

- PROV-OVERVIEW (Note), an overview of the PROV family of documents [*PROV-OVERVIEW*];
- PROV-PRIMER (Note), a primer for the PROV data model [*PROV-PRIMER*];
- PROV-O (Recommendation), the PROV ontology, an OWL2 ontology allowing the mapping of the PROV data model to RDF (this document);
- PROV-DM (Recommendation), the PROV data model for provenance [*PROV-DM*];
- PROV-N (Recommendation), a notation for provenance aimed at human consumption [*PROV-N*];
- PROV-CONSTRAINTS (Recommendation), a set of constraints applying to the PROV data model [*PROV-CONSTRAINTS*];
- PROV-XML (Note), an XML schema for the PROV data model [*PROV-XML*];
- PROV-AQ (Note), mechanisms for accessing and querying provenance [*PROV-AQ*];

- **PROV-DICTIONARY** (Note) introduces a specific type of collection, consisting of key-entity pairs [*PROV-DICTIONARY*];
- **PROV-DC** (Note) provides a mapping between PROV-O and Dublin Core Terms [*PROV-DC*];
- **PROV-SEM** (Note), a declarative specification in terms of first-order logic of the PROV data model [*PROV-SEM*];
- **PROV-LINKS** (Note) introduces a mechanism to link across bundles [*PROV-LINKS*].

Endorsed By W3C

This document has been reviewed by W3C Members, by software developers, and by other W3C groups and interested parties, and is endorsed by the Director as a W3C Recommendation. It is a stable document and may be used as reference material or cited from another document. W3C's role in making the Recommendation is to draw attention to the specification and to promote its widespread deployment. This enhances the functionality and interoperability of the Web.

Please Send Comments

This document was published by the Provenance Working Group as a Recommendation. If you wish to make comments regarding this document, please send them to public-prov-comments@w3.org (subscribe, archives). All comments are welcome.

This document was produced by a group operating under the 5 February 2004 W3C Patent Policy. W3C maintains a public list of any patent disclosures made in connection with the deliverables of the group; that page also includes instructions for disclosing a patent. An individual who has actual knowledge of a patent which the individual believes contains Essential Claim(s) must disclose the information in accordance with section 6 of the W3C Patent Policy.

Table of Contents

1. Introduction

The PROV Ontology (PROV-O) defines the OWL2 Web Ontology Language encoding of the PROV Data Model [*PROV-DM*]. This document describes the set of classes, properties, and restrictions that constitute the PROV Ontology. This ontology specification provides the foundation to implement provenance applications in different domains that can represent, exchange, and integrate provenance information generated in different systems and under different contexts. Together with the PROV Access and Query [*PROV-AQ*] and PROV Data Model [*PROV-DM*], this document forms a framework for provenance information interchange in domain-specific Web-based applications.

PROV-O is a lightweight ontology that can be adopted in a wide range of applications. With the exception of five axioms, PROV-O conforms to the OWL-RL profile [*OWL2-PRIMER*]. The PROV Ontology classes and properties are defined such that they can not only be used directly to represent provenance information, but also can be specialized for modeling application-specific provenance details in a variety of domains. Thus, the PROV Ontology is expected to be both directly usable in applications as well as serve as a *reference model* for creating domain-specific provenance ontologies and thereby facilitates interoperable provenance modeling. To demonstrate the use of PROV-O classes and properties, this document uses an example provenance scenario similar to the one introduced in the PROV-Primer [*PROV-PRIMER*].

The PROV Data Model [*PROV-DM*] introduces a set of concepts to represent provenance information in a variety of application domains. This document maps the PROV Data Model to PROV Ontology using the OWL2 ontology language [*OWL2-OVERVIEW*].

We briefly introduce some of the OWL2 modeling terms that will be used to describe the PROV Ontology. An OWL2 *instance* is an individual object in a domain of discourse, for example a person named Alice or a car named KITT. A set of individuals sharing common characteristics constitutes a *class*. Person and Car are examples of classes representing the set of individual persons and cars respectively. The OWL2 object properties are used to link individuals, classes, or create a property hierarchy. For example, the object property "hasOwner" can be used to link car with person. The OWL2 datatype properties are used to link individuals or classes to data values, including XML Schema datatypes [*XMLSCHEMA11-2*].

1.1 Compliance with this Document

For the purpose of compliance, the normative sections of this document are Section 1.1, Section 1.2, Section 3, Section 4, and Appendix B

- Information in tables is normative if it appears in a normative section.
- All figures and diagrams are informative.
- All examples are informative.

1.2 Notational Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

1.3 Namespaces

This section is non-normative.

The following namespace prefixes are used throughout this document.

Table 1: Prefix and Namespaces used in this specification

prefix	namespace IRI	definition
rdf	http://www.w3.org/1999/02/22-rdf-syntax-ns#	The RDF namespace [RDF-CONCEPTS]
xsd	http://www.w3.org/2000/10/XMLSchema#	XML Schema Namespace [XMLSCHEMA11-2]
owl	http://www.w3.org/2002/07/owl#	The OWL namespace [OWL2-OVERVIEW]
prov	http://www.w3.org/ns/prov#	The PROV namespace [PROV-DM]
(others)	(various)	All other namespace prefixes are used in examples only. In particular, IRIs starting with "http://example.com" represent some application-dependent IRI [IRI]

2. PROV-O at a glance

This section is non-normative.

PROV-O users may only need to use parts of the entire ontology, depending on their needs and according to how much detail they want to include in their provenance information. For this, the PROV-O terms (classes and properties) are grouped into three categories to provide an incremental introduction to the ontology: Starting Point terms, Expanded terms, and terms for Qualifying relationships.

Starting Point classes and properties provide the basis for the rest of the PROV Ontology and thus it is recommended that readers become comfortable with how to apply these terms before continuing to the remaining categories. These terms are used to create simple provenance descriptions that can be elaborated using terms from other categories. The classes and properties in this category are listed below and are discussed in Section 3.1.

prov:Entity   prov:Activity   prov:Agent

prov:wasGeneratedBy   prov:wasDerivedFrom   prov:wasAttributedTo   prov:startedAtTime   prov:used   prov:wasInformedBy   prov:endedAtTime   prov:wasAssociatedWith   prov:actedOnBehalfOf

Expanded classes and properties provide additional terms that can be used to relate classes in the Starting Point category. The terms in this category are applied in the same way as the terms in the Starting Point category. Many of the terms in this category are subclasses or subproperties of those in the Starting Point category. The classes and properties in this category are listed below and are discussed in Section 3.2.

prov:Collection   prov:EmptyCollection   prov:Bundle   prov:Person   prov:SoftwareAgent   prov:Organization   prov:Location

prov:alternateOf   prov:specializationOf   prov:generatedAtTime   prov:hadPrimarySource   prov:value   prov:wasQuotedFrom   prov:wasRevisionOf   prov:invalidatedAtTime   prov:wasInvalidatedBy   prov:hadMember   prov:wasStartedBy   prov:wasEndedBy   prov:invalidated   prov:influenced   prov:atLocation   prov:generated

Qualified classes and properties provide elaborated information about binary relations asserted using Starting Point and Expanded properties. The terms in this category are applied using a pattern that differs from those in the Starting Point and Expanded categories. While the relations from the previous two categories are applied as direct, binary assertions, the terms in this category are used to provide additional attributes of the binary relations. The pattern used in this category allows users to provide elaborate details that are not available using only Starting Point and Expanded terms. The classes and properties in this category are listed below and are discussed in Section 3.3.

prov:Influence   prov:EntityInfluence   prov:Usage   prov:Start   prov:End   prov:Derivation   prov:PrimarySource   prov:Quotation   prov:Revision   prov:ActivityInfluence   prov:Generation   prov:Communication   prov:Invalidation   prov:AgentInfluence   prov:Attribution   prov:Association   prov:Plan   prov:Delegation   prov:InstantaneousEvent   prov:Role

prov:wasInfluencedBy   prov:qualifiedInfluence   prov:qualifiedGeneration   prov:qualifiedDerivation   prov:qualifiedPrimarySource   prov:qualifiedQuotation   prov:qualifiedRevision   prov:qualifiedAttribution   prov:qualifiedInvalidation   prov:qualifiedStart   prov:qualifiedUsage   prov:qualifiedCommunication   prov:qualifiedAssociation   prov:qualifiedEnd   prov:qualifiedDelegation   prov:influencer   prov:entity   prov:hadUsage   prov:hadGeneration   prov:activity   prov:agent   prov:hadPlan   prov:hadActivity

prov:atTime   prov:hadRole

3. The PROV-O Ontology Description

This section introduces the terms in each of the following categories:

- Starting Point Terms
- Expanded Terms
- Qualified Terms

3.1 Starting Point Terms

The Starting Point category is a small set of classes and properties that can be used to create simple, initial provenance descriptions. Three classes provide a basis for the rest of PROV-O:

- An `prov:Entity` is a physical, digital, conceptual, or other kind of thing with some fixed aspects; entities may be real or imaginary.
- An `prov:Activity` is something that occurs over a period of time and acts upon or with entities; it may include consuming, processing, transforming, modifying, relocating, using, or generating entities.
- An `prov:Agent` is something that bears some form of responsibility for an activity taking place, for the existence of an entity, or for another agent's activity.

The three primary classes relate to one another and to themselves using the properties shown in the following figure.

Activities **start** and **end** at particular points in time (described using properties `prov:startedAtTime` and `prov:endedAtTime`, respectively) and during their lifespan can **use** and **generate** a variety of Entities (described with `prov:used` and `prov:wasGeneratedBy`, respectively). For example, a blog writing activity may use a particular dataset and generate a bar chart. By expressing usage and generation, one can construct provenance chains comprising both Activities and Entities.

In addition, we can say that an Activity `prov:wasInformedBy` another Activity to provide some dependency information without explicitly providing the activities' start and end times. A `prov:wasInformedBy` relation between Activities suggests that the informed Activity used an Entity that was generated by the informing Activity, but the Entity itself is unknown or is not of interest. So, the `prov:wasInformedBy` property allows the construction of provenance chains comprising only Activities.

Provenance chains comprising only Entities can be formed using the `prov:wasDerivedFrom` property. A derivation is a transformation of one entity into another. For example, if the Activity that created the bar chart is not known or is not of interest, then we can say that the bar chart `prov:wasDerivedFrom` the dataset. Arbitrary RDF properties can be used to describe the fixed aspects of an Entity that are interesting within a particular application (for example, the file size and format of the dataset, or the aspect ratio of the bar chart).

While the properties `prov:used`, `prov:wasGeneratedBy`, `prov:wasInformedBy`, and `prov:wasDerivedFrom` can be used to construct provenance chains among Activities and Entities, Agents may also be ascribed responsibility for any Activity or Entity within a provenance chain. An Agent's responsibility for an Activity or Entity is described using the properties `prov:wasAssociatedWith` and `prov:wasAttributedTo`, respectively. Agents can also be responsible for other Agents' actions. In this case of delegation, the influencing Agent `prov:actedOnBehalfOf` another Agent that also bears responsibility for the influenced Activity or Entity.

The properties rdf:type and rdfs:label are used to express prov:type and prov:label, respectively.

Figure 1. The three Starting Point classes and the properties that relate them.
The diagrams in this document depict Entities as yellow ovals,
Activities as blue rectangles, and Agents as orange pentagons.
The responsibility properties are shown in pink.

Example 1: The following PROV-O describes the resources involved when creating a chart about crime statistics. The example uses only Starting Point terms and serves as a basis for elaboration that will be described in subsequent sections. In the example, Derek performs an aggregation of some government crime data, grouping by national regions that are described in a separate dataset by a civil action group.

```
Example

@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix foaf: <http://xmlns.com/foaf/0.1/> .
```

```
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.org#> .

:bar_chart
   a prov:Entity;
   prov:wasGeneratedBy  :illustrationActivity;
   prov:wasDerivedFrom  :aggregatedByRegions;
   prov:wasAttributedTo :derek;
.

:derek
   a foaf:Person, prov:Agent;
   foaf:givenName        "Derek";
   foaf:mbox             <mailto:derek@example.org>;
   prov:actedOnBehalfOf :natonal_newspaper_inc;
.

:national_newspaper_inc
   a foaf:Organization, prov:Agent;
   foaf:name "National Newspaper, Inc.";
.

:illustrationActivity
   a prov:Activity;
   prov:used              :aggregatedByRegions;
   prov:wasAssociatedWith :derek;
   prov:wasInformedBy     :aggregationActivity;
.

:aggregatedByRegions
   a prov:Entity;
   prov:wasGeneratedBy  :aggregationActivity;
   prov:wasAttributedTo :derek;
.

:aggregationActivity
   a prov:Activity;
   prov:startedAtTime    "2011-07-14T01:01:01Z"^^xsd:dateTime;
   prov:wasAssociatedWith :derek;
   prov:used              :crimeData;
   prov:used              :nationalRegionsList;
   prov:endedAtTime      "2011-07-14T02:02:02Z"^^xsd:dateTime;
.

:crimeData
   a prov:Entity;
   prov:wasAttributedTo :government;
.
:government a foaf:Organization, prov:Agent .

:nationalRegionsList
   a prov:Entity;
   prov:wasAttributedTo :civil_action_group;
.
:civil_action_group a foaf:Organization, prov:Agent .
```

The example states that the agent :derek was associated with two activities: :aggregationActivity and :illustrationActivity. The activity :aggregationActivity used the entities :crimeData (a crime statistics dataset) and :nationalRegionsList (a list of national regions), and generated a new entity, :aggregatedByRegions that aggregates the statistics in :crimeData according to the regions in :nationalRegionsList. The :aggregatedByRegions entity was then used by the :illustrationActivity activity, to generate a new entity :bar_chart that depicts the aggregated statistics.

The example also states that the activity :illustrationActivity was informed by the activity :aggregationActivity. Indeed, the former used the entity :aggregatedByRegions, which was generated by the latter.

Because the agent :derek was associated with the activities :aggregationActivity and :illustrationActivity, the entities generated by these activities, i.e., :aggregatedByRegions and :bar_chart, were also attributed to him.

Finally, the example states that the agent :derek acted on behalf of the organization :national_newspaper_inc.

Figure 2. A graphical illustration of the PROV-O in Example 1, showing how the three Starting Point classes relate.
The diagrams in this document depict Entities as yellow ovals, Activities as blue rectangles,
and Agents as orange pentagons. The responsibility properties are shown in pink.

3.2 Expanded Terms

The terms introduced in this section provide additional ways to describe the provenance among Entities, Activities, and Agents. The additional terms are illustrated in the following figure and can be separated into five different categories.

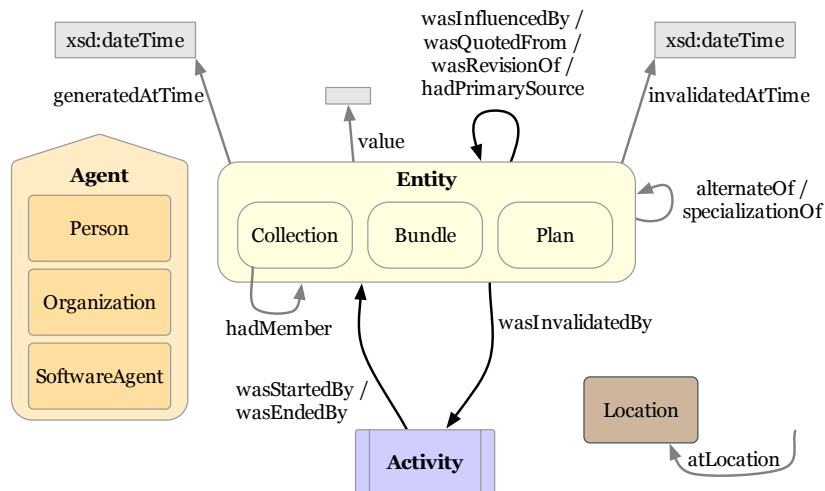

Figure 3. The expanded terms build upon those in the Starting Points section.
The diagrams in this document depict Entities as yellow ovals, Activities as blue rectangles, and Agents as orange pentagons.
The domain of prov:atLocation (prov:Activity or prov:Entity or prov:Agent or prov:InstantaneousEvent) is not illustrated.

The **first** category extends the Starting Point terms with subclasses, subproperties, and a superproperty.

Three subclasses of Agent (prov:Person, prov:Organization, and prov:SoftwareAgent) and three subclasses of Entity are provided (prov:Collection, prov:Bundle, and prov:Plan).

A prov:Collection is an Entity that provides a structure (e.g. set, list, etc.) to some constituents (which are themselves Entities). The prov:Collection class can be used to express the provenance of the collection itself: e.g. who maintained the collection, which members it contained as it evolved, and how it was assembled. The prov:hadMember property is used to assert membership in a collection.

A prov:Bundle is a named set of provenance descriptions, which may itself have provenance. The named set of provenance descriptions may be expressed as PROV-O or any other form. The subclass of Bundle that names a set of PROV-O assertions is not provided by PROV-O, since it is more appropriate to do so using other recommendations, standards, or technologies. In any case, a Bundle of PROV-O assertions is an abstract set of RDF triples, and adding or removing a triple creates a new distinct Bundle of PROV-O assertions.

A `prov:Plan` is an entity that represents a set of actions or steps intended by one or more agents to achieve some goals.

More general and more specific properties are also provided by the expanded terms. More generally, the property `prov:wasInfluencedBy` is a superproperty that relates any influenced Entity, Activity, or Agent to any other influencing Entity, Activity, or Agent that had an effect on its characteristics. Three subproperties of `prov:wasDerivedFrom` are also provided for certain kinds of derivation among Entities: `prov:wasQuotedFrom` cites a potentially larger Entity (such as a book, blog, or image) from which a new Entity was created by repeating some or all of the original, `prov:wasRevisionOf` indicates that the derived Entity contains substantial content from the original Entity (e.g., two editions of a book), and `prov:hadPrimarySource` cites a preceding Entity produced by some agent with direct experience and knowledge about the topic (such as a reading from a sensor, or a journal written during an historical event).

The **second** category of expanded terms relates Entities according to their levels of abstraction, where some Entities may present more specific aspects than their more general counterparts. While `prov:specializationOf` links a more specific Entity to a more general one (e.g., today's BBC news home page versus BBC's news home page on any day), `prov:alternateOf` links Entities that present aspects of the same thing, but not necessarily the same aspects or at the same time (e.g., the serialization of a document in different formats or a backup copy of a computer file).

The **third** category of expanded terms allows further description of Entities. The property `prov:value` provides a literal value that is a direct representation of an entity. For example, the `prov:value` of a quote could be a string of the sentences stated, or the `prov:value` of an Entity involved in a numeric calculation could be the xsd:integer four. The property `prov:atLocation` can be used to describe the `prov:Location` of any Entity, Activity, Agent, or `prov:InstantaneousEvent` (i.e., the starting or ending of an activity or the generation, usage, or invalidation of an entity). The properties used to describe instances of `prov:Location` are outside the scope of PROV-O; reuse of other existing vocabulary is encouraged.

The **fourth** category of expanded terms describes the lifetime of an Entity beyond being **generated** by an Activity and **used** by other Activities. For example, a painting could not have been displayed before it was painted, and it could not be sold after it was destroyed by fire. Similar to how Activities have start and end times, an Entity may be bound by points in time for which it was generated or is no longer usable. The properties `prov:generatedAtTime` and `prov:invalidatedAtTime` can be used to bound the starting and ending moments of an Entity's existence. The Activities that led to the generation or invalidation of an Entity can be provided using `prov:wasGeneratedBy` and `prov:wasInvalidatedBy`, respectively. `prov:generated` and `prov:invalidated` are the inverses of `prov:wasGeneratedBy` and `prov:wasInvalidatedBy`, respectively, and are defined to facilitate Activity-as-subject as well as Entity-as-subject descriptions. For more about inverses, see the Appendix B.

The **fifth** category of expanded terms describes the lifetime of an Activity beyond its start and end times and predecessor Activities. Activities may also be started or ended by Entities, which are described using the properties `prov:wasStartedBy` and `prov:wasEndedBy`, respectively. Since Entities may start or end Activities, and Agents may be Entities, then Agents may also start or end Activities.

The following examples illustrate the expanded terms by elaborating the crime chart example from the previous section. After aggregating the dataset and creating the chart, Derek published a post to exhibit his work.

.
```

Agent :derek, acting again on behalf of the :national_newspaper_inc organization, used the :postEditor tool to publish a post about his recent data analysis :aggregatedByRegions. The blog editing tool tracked Derek's actions as PROV-O assertions and published them as a Bundle (the current file <>). The tool recorded that :derek started and ended the publishing activity (:publicationActivity1123) that generated the post :post9821v1. The post included a permanent link where the content of the latest version is available (:more-crime-happens-in-cities) in addition to a textual snapshot of the current version (using prov:value). Derek also included additional domain-specific descriptions of the post, such as its title.

Shortly after publishing the post, Derek noticed a typographical error in his narrative. Because the fix would be minimal, he did not record the activity that led to the new version. Instead, he related the new version (:post9821v2) as a revision of the previous (:post9821v1). Since both versions of the blog are forms of the long-standing blog permalink :more-crime-happens-in-cities, the revisions are alternates of one another and each is a prov:specializationOf of :more-crime-happens-in-cities.
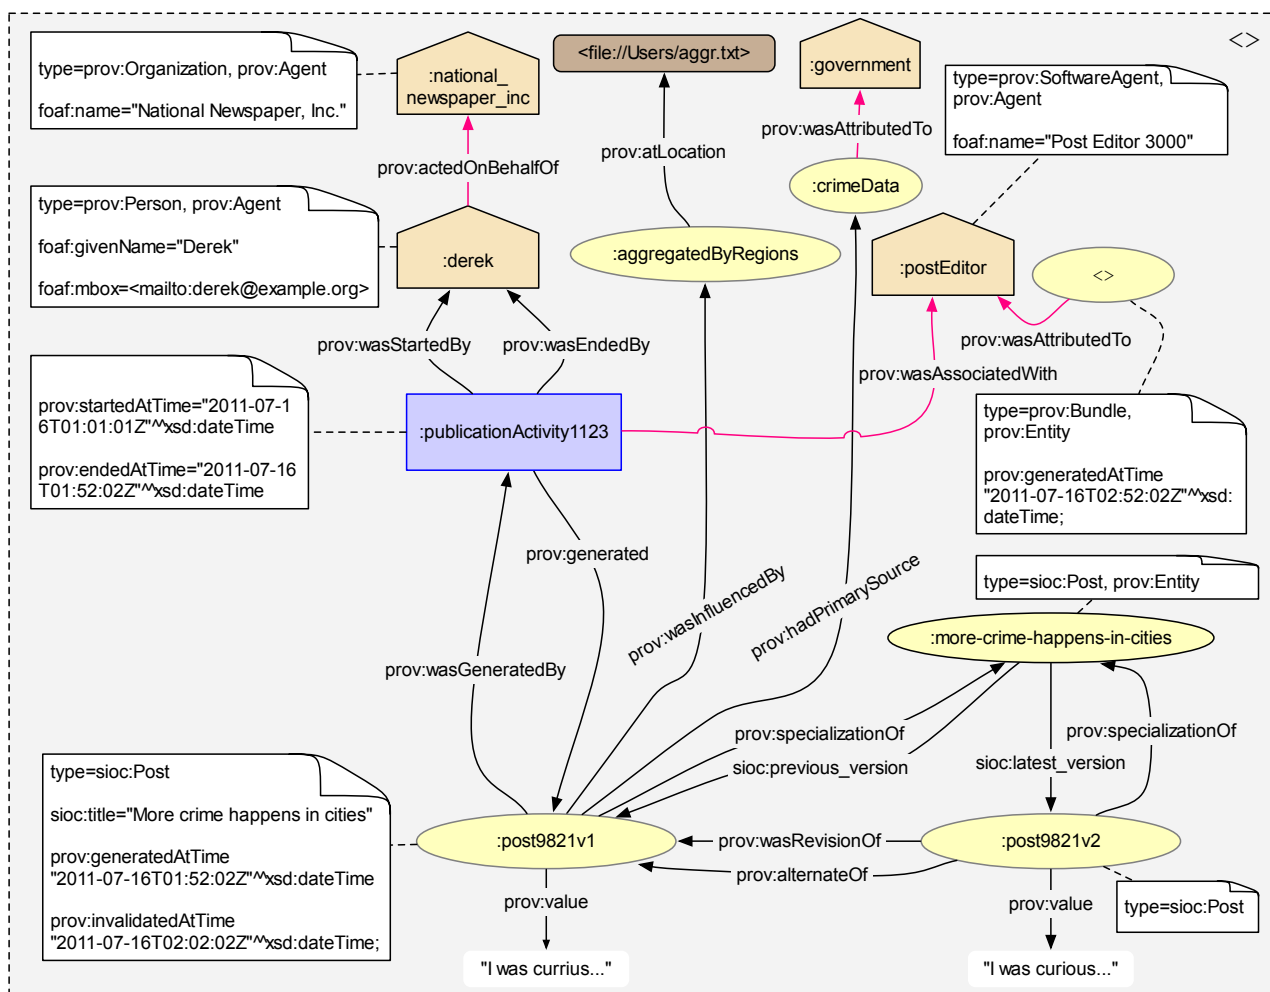

[Figure 4](). An illustration of the PROV-O assertions in [Example 2](), where Derek
published two versions of a blog for the National Newspaper, Inc.
The diagrams in this document depict Entities as yellow ovals, Activities as blue rectangles,
and Agents as orange pentagons. The responsibility properties are shown in pink.

Shortly after Derek published his blog post, Monica adapted the text for a wider audience in a new post (`:post9822`). This rewrite is an alternate, abbreviated view of the same topic that Derek wrote about and was created from his original text. Since the provenance produced by the activities of Derek and Monica corresponded to different user views, the system automatically published it in a different `prov:Bundle`. The tool also asserted provenance about the bundle that it produced (e.g., the date of creation, its creator, and the fact that it Derek's bundle was used). Because a bundle is a kind of entity, all provenance assertions that can be made about entities can also be made about bundles. The use of bundles enables the creation of provenance of provenance.

## Revised post for a different audience is a new resource.

:post9822
    a sioc:Post, prov:Entity;
    sioc:title "More crime happens in cities (for dummies)";
    prov:wasAttributedTo  :monica,
                          :postEditor;
    prov:alternateOf      :more-crime-happens-in-cities;    ## This post is an alternate of Derek's blog.
    prov:value            "A quick overview of Derek's..."; ## Snapshot with the content of this version
    prov:wasRevisionOf    :post9821v2;                      ## Monica rewrote Derek's version 2 to create hers.
.
```

After some time, John wrote his own conclusions in his own post (`:post19201`) quoting the previous two posts. Each quote that John makes (`:quote_from_monica` and `:quote_from_derek`) is a new entity derived from the previous blogs and is annotated with the time that the quote was taken. The provenance of John's blog notes that his post is the result of the quotes that he took from Derek and Monica. The blog post is also derived from Derek's `:aggregatedByRegions` dataset because John inspected it and found a concern that he discusses in his blog. All the provenance statements related to John's post are grouped in a new `prov:Bundle`.

[Example 4]():

```
Example

@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix foaf: <http://xmlns.com/foaf/0.1/> .
@prefix sioc: <http://rdfs.org/sioc/ns#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://www.example.org#> .
@base         <http://www.example.com/john-bundle.ttl> .

<>
    a prov:Bundle, prov:Entity;
    prov:wasAttributedTo :postEditor;
    prov:wasDerivedFrom <http://www.example.com/derek-bundle.ttl>,
                        <http://www.example.com/monica-bundle.ttl>;
    prov:generatedAtTime "2012-08-08T08:08:08Z"^^xsd:dateTime;
.

:publicationActivity1124
    a prov:Activity;
    prov:wasAttributedTo :postEditor,
                         :john;
    prov:generated :post19201;
.

:post19201
    a sioc:Post, prov:Entity;
    prov:wasAttributedTo :john;
    prov:value "I'm not so sure that...";
    prov:wasDerivedFrom :quote_from_derek,
                        :quote_from_monica,
                        :aggregatedByRegions;
    prov:wasGeneratedBy :publicationActivity1124;
.

:john
    a prov:Person, prov:Agent;
    foaf:name "John";
.
```

```
:quote_from_derek
    a prov:Entity;
    prov:value "Analysis of the datasets demonstrates that there is more crime.";
    prov:wasQuotedFrom  :more-crime-happens-in-cities;
    prov:generatedAtTime "2012-08-08T01:01:01Z"^^xsd:dateTime;
.

:quote_from_monica
    a prov:Entity;
    prov:value "In summary, there are clearly more crimes in the country.";
    prov:wasQuotedFrom  :post9822;
    prov:generatedAtTime "2012-08-08T02:02:02Z"^^xsd:dateTime;
.
```

Unfortunately, there was a problem in the servers where `:post19201` was being stored, and all the data related to the post was lost permanently. Thus, the system invalidated the entity automatically and notified John about the error.

3.3 Qualified Terms

The Qualified Terms category is the result of applying the **Qualification Pattern** [*LD-Patterns-QR*] to the simple (unqualified) relations available in the Starting Point and Expanded categories. The terms in this category are for users who wish to provide further details about the provenance-related influence among Entities, Activities, and Agents.

The Qualification Pattern restates an unqualified influence relation by using an intermediate class that represents the influence between two resources. This new instance, in turn, can be annotated with additional descriptions of the influence that one resource had upon another. The following two tables list the influence relations that can be qualified using the Qualification Pattern, along with the properties used to qualify them. For example, the second row of the first table indicates that to elaborate how an `prov:Activity` `prov:used` a particular `prov:Entity`, one creates an instance of `prov:Usage` that indicates the influencing entity with the `prov:entity` property. Meanwhile, the influenced `prov:Activity` indicates the `prov:Usage` with the property `prov:qualifiedUsage`. The resulting structure that qualifies the an Activity's usage of an Entity is illustrated in Figure 4a below.

Seven Starting Point relations can be further described using the Qualification Pattern. They are listed in the following normative table.

Table 2: Qualification Property and Qualified Influence Class used to qualify a Starting-point Property.

Influenced Class	Unqualified Influence	Influencing Class	Qualification Property	Qualified Influence	Influencer Property
prov:Entity	prov:wasGeneratedBy	prov:Activity	prov:qualifiedGeneration	prov:Generation	prov:activity
prov:Entity	prov:wasDerivedFrom	prov:Entity	prov:qualifiedDerivation	prov:Derivation	prov:entity
prov:Entity	prov:wasAttributedTo	prov:Agent	prov:qualifiedAttribution	prov:Attribution	prov:agent
prov:Activity	prov:used	prov:Entity	prov:qualifiedUsage	prov:Usage	prov:entity
prov:Activity	prov:wasInformedBy	prov:Activity	prov:qualifiedCommunication	prov:Communication	prov:activity
prov:Activity	prov:wasAssociatedWith	prov:Agent	prov:qualifiedAssociation	prov:Association	prov:agent
prov:Agent	prov:actedOnBehalfOf	prov:Agent	prov:qualifiedDelegation	prov:Delegation	prov:agent

Seven Expanded relations can be further described using the Qualification Pattern. They are listed in the following normative table.

Table 3: Qualification Property and Qualified Influence Class used to qualify an Expanded Property.

Influenced Class	Unqualified Influence	Influencing Class	Qualification Property	Qualified Influence	Influencer Property
prov:Entity or prov:Activity or prov:Agent	prov:wasInfluencedBy	prov:Entity or prov:Activity or prov:Agent	prov:qualifiedInfluence	prov:Influence	prov:influencer

prov:Entity	prov:hadPrimarySource	prov:Entity	prov:qualifiedPrimarySource	prov:PrimarySource	prov:entity
prov:Entity	prov:wasQuotedFrom	prov:Entity	prov:qualifiedQuotation	prov:Quotation	prov:entity
prov:Entity	prov:wasRevisionOf	prov:Entity	prov:qualifiedRevision	prov:Revision	prov:entity
prov:Entity	prov:wasInvalidatedBy	prov:Activity	prov:qualifiedInvalidation	prov:Invalidation	prov:activity
prov:Activity	prov:wasStartedBy	prov:Entity	prov:qualifiedStart	prov:Start	prov:entity
prov:Activity	prov:wasEndedBy	prov:Entity	prov:qualifiedEnd	prov:End	prov:entity

The qualification classes and properties shown in the previous two tables can also be found in the normative cross reference in the next section of this document. All influence classes (e.g. `prov:Association`, `prov:Usage`) are extensions of `prov:Influence` and either `prov:EntityInfluence`, `prov:ActivityInfluence`, or `prov:AgentInfluence`, which determine the property used to cite the influencing resource (either `prov:entity`, `prov:activity`, or `prov:agent`, respectively). Because `prov:Influence` is a broad relation, its most specific subclasses (e.g. `prov:Communication`, `prov:Delegation`, `prov:End`, `prov:Revision`, etc.) should be used when applicable.

Example 6:

For example, given the unqualified statement:

```
Example

:e1
    a prov:Entity;
    prov:wasGeneratedBy :a1;
.

:a1 a prov:Activity .
```

One can find that `prov:wasGeneratedBy` can be qualified using the qualification property `prov:qualifiedGeneration`, the class `prov:Generation` (a subclass of `prov:ActivityInfluence`), and the property `prov:activity`. From this, the influence relation above can be restated with the *qualification pattern* as:

Example 7:

```
Example

:e1
    a prov:Entity;
    prov:wasGeneratedBy      :a1;
    prov:qualifiedGeneration :e1Gen; # Add the qualification.
.

:e1Gen
    a prov:Generation;
    prov:activity            :a1;    # Cite the influencing Activity.
    ex:foo                   :bar;   # Describe the Activity :a1's influence upon the Entity :e1.
.

:a1 a prov:Activity .
```

The asserter can thus attach additional properties to `:e1Gen` to describe the generation of `:e1` by `:a1`.

As can be seen in this example, qualifying an influence relation provides a second form (e.g. `:e1 prov:qualifiedGeneration :e1Gen`) to express an equivalent influence relation (e.g. `:e1 prov:wasGeneratedBy :a1`). It is correct and acceptable for an implementer to use either qualified or unqualified forms as they choose (or both), and a consuming application should be prepared to recognize either form. Consuming applications SHOULD recognize both qualified and unqualified forms, and treat the qualified form as implying the unqualified form. Because the qualification form is more verbose, the unqualified form should be favored in cases where additional properties are not provided. When the qualified form is expressed, including the equivalent unqualified form can facilitate PROV-O consumption, and is thus encouraged.

In addition to the previous two tables, Figure 4 illustrates the classes and properties needed to apply the qualification pattern to ten of the fourteen qualifiable influence relations. For example, while `prov:qualifiedUsage`, `prov:Usage`, and `prov:entity` are used to qualify `prov:used` relations, `prov:qualifiedAssociation`, `prov:Association`, and `prov:agent` are used to qualify `prov:wasAssociatedWith` relations. This pattern applies to the twelve other influence relations that can be qualified.

In subfigure **a** the `prov:qualifiedUsage` property parallels the `prov:used` property and references an instance of `prov:Usage`, which in turn provides attributes of the `prov:used` relation between the Activity and Entity. The `prov:entity` property is used to cite the Entity that was used by the Activity. In this case, the time that the Activity used the Entity is provided using the `prov:atTime` property and a literal `xsd:dateTime` value. The `prov:atTime` property can be used to describe any `prov:InstantaneousEvent` (including `prov:Start`, `prov:Generation`, `prov:Usage`, `prov:Invalidation`, and `prov:End`).

Similarly in subfigure **j**, the `prov:qualifiedAssociation` property parallels the `prov:wasAssociatedWith` property and references an instance of `prov:Association`, which in turn provides attributes of the `prov:wasAssociatedWith` relation between the Activity and Agent. The `prov:agent` property is used to cite the Agent that influenced the Activity. In this case, the plan of actions and steps that the Agent used to achieve its goals is provided using the `prov:hadPlan` property and an instance of `prov:Plan`. Further, the `prov:hadRole` property and `prov:Role` class can be used to describe the function that the agent served with respect to the Activity. Both `prov:Plan` and `prov:Role` are left to be extended by applications.
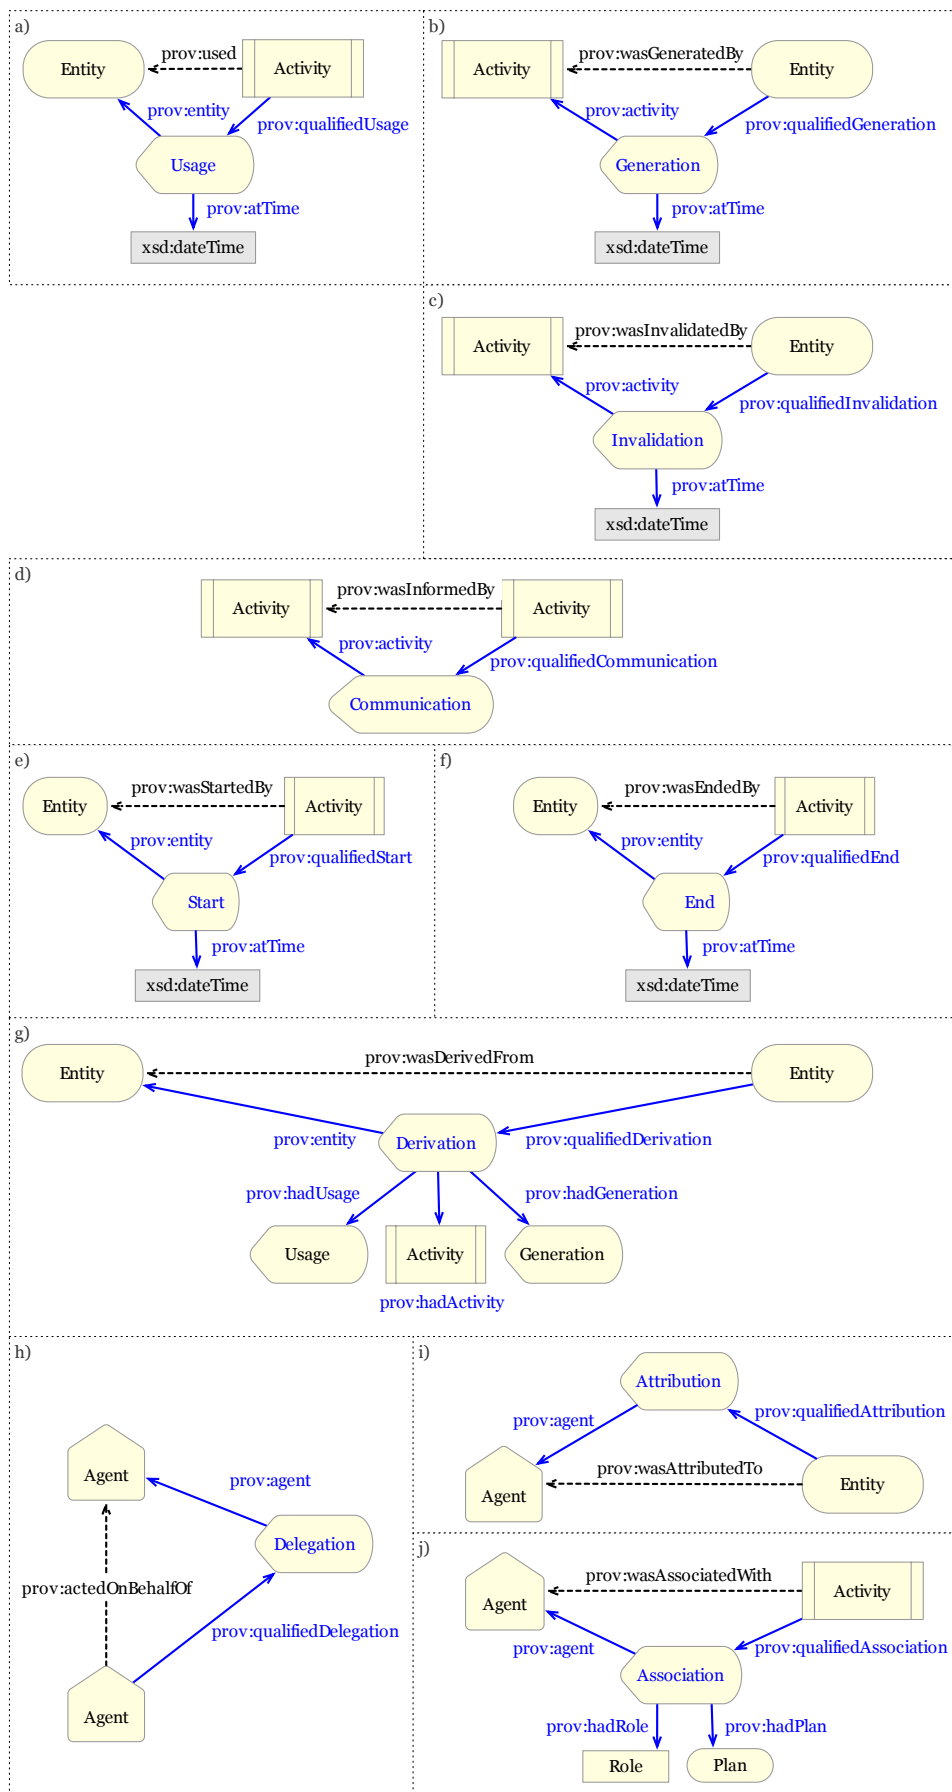

Figure 4: Illustration of the properties and classes to use (in blue) to qualify the starting point and expanded influence relations (**dotted black**). The diagrams in this document depict Entities as ovals, Activities as rectangles, and Agents as pentagons. Quotation, Revision, and PrimarySource are omitted because they are special forms of Derivation and follow the same pattern as subfigure **g**.

The following two examples show the result of applying the Usage and Association patterns to the chart-making example from Section 3.1.

Qualified Usage

The `prov:qualifiedUsage` property parallels the `prov:used` property to provide an additional description to `:illustrationActivity`. The instance of `prov:Usage` cites the data used (`:aggregatedByRegions`) and the time the activity used it (`2011-07-14T03:03:03Z`).

```
Example

@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.org#> .

:illustrationActivity
   a prov:Activity;              ## Using Starting Point terms,
   prov:used :aggregatedByRegions; ##  the illustration activity used the aggregated data (to create the bar chart).
.

:aggregatedByRegions a prov:Entity .

:illustrationActivity
   prov:qualifiedUsage [                             ## Qualify how the :illustrationActivity
      a prov:Usage;                                  ##   used
      prov:entity :aggregatedByRegions;              ##     the Entity :aggregatedByRegions

      prov:atTime "2011-07-14T03:03:03Z"^^xsd:dateTime; ## Qualification: The aggregated data was used
                                                     ##   at a particular time to create the bar chart..
   ];
.
```

Qualified Association

The `prov:qualifiedAssociation` property parallels the `prov:wasAssociatedWith` property to provide an additional description about the `:illustrationActivity` that Derek influenced. The instance of `prov:Association` cites the influencing agent (`:derek`) that followed the instructions (`:tutorial_blog`). Further, Derek served the role of `:illustrationist` during the activity.

```
Example

@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.org#> .

:illustrationActivity
   a prov:Activity;              ## Using Starting Point terms,
   prov:wasAssociatedWith :derek;  ##  the illustration activity was associated with Derek in some way.
.

:derek a prov:Agent .

:illustrationActivity
   prov:qualifiedAssociation [      ## Qualify how the :illustrationActivity
      a prov:Association;           ##   was associated with
      prov:agent    :derek         ##     the Agent Derek.

      prov:hadRole :illustrationist; ## Qualification: The role that Derek served.
      prov:hadPlan :tutorial_blog;   ## Qualification: The plan (or recipe, instructions)
                                     ##   that Derek followed when creating the graphical chart.
   ];
.

:tutorial_blog   a prov:Plan, prov:Entity .
:illustrationist a prov:Role .
```

This section finishes with two more examples of qualification as applied to the chart-making example from [Section 3.1](#).

Qualified Generation

The `prov:qualifiedGeneration` property parallels the `prov:wasGeneratedBy` property to provide an additional description to `:bar_chart`. The instance of `prov:Generation` cites the time (2011-07-14T15:52:14Z) that the activity (`:illustrationActivity`) generated the chart (`:bar_chart`).

```
Example

@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.org#> .

:bar_chart
   a prov:Entity;                               ## Using Starting Point terms,
   prov:wasGeneratedBy :illustrationActivity;   ##  the chart was generated in an illustration activity.
.

:illustrationActivity a prov:Activity .

:bar_chart
   prov:qualifiedGeneration [                   ## Qualify how the :bar_chart
      a prov:Generation;                        ##   was generated by
      prov:activity :illustrationActivity;      ##     the Activity :illustrationActivity.

      prov:atTime "2011-07-14T15:52:14Z"^^xsd:dateTime; ## Qualification: The Activity generated
                                                ##   the bar_chart at a particular time.
   ];
```

```
                                .
```

Example 11:

Qualified Derivation

The `prov:qualifiedDerivation` property parallels the `prov:wasDerivedFrom` property to provide an additional description to `:bar_chart`. The instance of `prov:Derivation` cites the activity (`:illustrationActivity`) and the Usages and Generations that the activity conduced to create the `:bar_chart`.

```
Example

@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.org#> .

:bar_chart
   a prov:Entity;                              ## Using Starting Point terms,
   prov:wasDerivedFrom :aggregatedByRegions;  ##   the chart was derived from the aggregated dataset.
.

:aggregatedByRegions a prov:Entity .

:bar_chart
   prov:qualifiedDerivation [                  ## Qualify
      a prov:Derivation;                       ##   how :bar_chart was derived from
      prov:entity        :aggregatedByRegions; ##    the dataset Entity :aggregatedByRegions.

      prov:hadActivity   :aggregating_activity;   ## Qualification: The activity that derived the :bar_chart.
      prov:hadUsage      :use_of_aggregatedData;  ## Qualification: How the activity used :aggregatedByRegions.
      prov:hadGeneration :generation_of_bar_chart; ## Qualification: How the activity generated the :bar_chart.
   ];
.
```

4. Cross reference for PROV-O classes and properties

This section provides details for each class and property defined by the PROV Ontology, grouped by the categories described above:

- Starting Point Terms
- Expanded Terms
- Qualified Terms

The superscripts [op] and [dp] denote that a property is an OWL object property or data property, respectively.

Each PROV-O term in this cross reference links to the corresponding PROV-DM concept. The PROV-DM's table Cross-References to PROV-O and PROV-N provides an overview of the correspondences between PROV-O and PROV-DM.

The qualification classes and properties shown in Table 2 and Table 3 of the previous section can also be found in each entry of this cross reference. If the property can be qualified, the **can be qualified with** header indicates the qualifying property and influence class that should be used. Conversely, the **qualifies** headers in the listings for qualification terms indicate the unqualified property that they qualify. In the OWL file itself, the annotation properties `prov:qualifiedForm` and `prov:unqualifiedForm` provide the same linkages between the unqualified properties and their qualifiying terms.

Most examples shown in this cross reference are encoded using the Turtle RDF serialization. When it is convenient to do so (e.g., when an example describes a `prov:Bundle`), it may use the [*TRIG*] syntax. Although this document does not specify how to encode Bundles in RDF, TriG's named graph construct is used only to illustrate the concept of creating a named set of PROV assertions. Note that all examples are non-normative.

4.1 Starting Point Terms

The classes and properties that provide a basis for all other PROV-O terms are discussed in Section 3.1.

prov:Entity prov:Activity prov:Agent

prov:wasGeneratedBy prov:wasDerivedFrom prov:wasAttributedTo prov:startedAtTime prov:used prov:wasInformedBy prov:endedAtTime prov:wasAssociatedWith prov:actedOnBehalfOf

(1) Class: prov:Entity   back to starting-point classes

IRI: http://www.w3.org/ns/prov#Entity

An entity is a physical, digital, conceptual, or other kind of thing with some fixed aspects; entities may be real or imaginary.

Example

```
@prefix rdfs:    <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:     <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:     <http://www.w3.org/2002/07/owl#> .
@prefix dcterms: <http://purl.org/dc/terms/> .
@prefix prov:    <http://www.w3.org/ns/prov#> .
```

```
@prefix :          <http://example.com/> .

:bar_chart
    a prov:Entity;
    dcterms:title "Aggregated statistics from the crime file"^^xsd:string;
    prov:wasAttributedTo :derek;
.

:derek a prov:Agent .
```

described with properties:

has subclasses
prov:Collection , prov:Plan , prov:Bundle

PROV-DM term
entity

(2) Class: prov:Activity

IRI: http://www.w3.org/ns/prov#Activity

An activity is something that occurs over a period of time and acts upon or with entities; it may include consuming, processing, transforming, modifying, relocating, using, or generating entities.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:graduation
    a prov:Activity, :Graduation;
    prov:startedAtTime "2012-04-15T13:00:00-04:00"^^xsd:dateTime;
    prov:used        :ms_smith;
    prov:generated   :doctor_smith;
    prov:endedAtTime  "2012-04-15T14:30:00-04:00"^^xsd:dateTime;
.

in range of
prov:activity ^{op} prov:wasInformedBy ^{op} prov:wasGeneratedBy ^{op} prov:hadActivity ^{op} prov:wasInvalidatedBy ^{op}

PROV-DM term
Activity

(3) Class: prov:Agent

IRI: http://www.w3.org/ns/prov#Agent

An agent is something that bears some form of responsibility for an activity taking place, for the existence of an entity, or for another agent's activity.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
```

```
@prefix xsd:   <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:   <http://www.w3.org/2002/07/owl#> .
@prefix prov:  <http://www.w3.org/ns/prov#> .
@prefix foaf:  <http://xmlns.com/foaf/0.1/> .
@prefix :      <http://example.com#> .

:derek
   a prov:Agent, prov:Person;
   foaf:givenName      "Derek"^^xsd:string;
   foaf:mbox           <mailto:derek@example.org>;
   foaf:homePage       <http://derek.example.com>;
   prov:actedOnBehalfOf :national_newspaper_inc;
.

:national_newspaper_inc
   a prov:Agent, prov:Organization;
   foaf:name "National Newspaper, Inc.";
.
```

described with properties:

prov:actedOnBehalfOf ^{op} , prov:qualifiedDelegation ^{op}

prov:wasInfluencedBy ^{op} , prov:qualifiedInfluence ^{op} , prov:atLocation ^{op}

in range of

prov:actedOnBehalfOf ^{op} prov:agent ^{op} prov:wasAssociatedWith ^{op} prov:wasAttributedTo ^{op}

has subclasses

prov:Organization , prov:Person , prov:SoftwareAgent

PROV-DM term

agent

---

(4) Property: prov:wasGeneratedBy ^{op}   back to starting-point properties

IRI: http://www.w3.org/ns/prov#wasGeneratedBy

Generation is the completion of production of a new entity by an activity. This entity did not exist before generation and becomes available for usage after this generation.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:bar_chart
   a prov:Entity;
   prov:wasGeneratedBy :illustrating;
.

:illustrating a prov:Activity .
```

has super-properties

- prov:wasInfluencedBy ^{op}

has domain

- prov:Entity

has range

- prov:Activity

can be qualified with

- prov:Generation
- prov:qualifiedGeneration ^{op}

PROV-DM term

Generation

---

(5) Property: prov:wasDerivedFrom ^{op}   back to starting-point properties

IRI: http://www.w3.org/ns/prov#wasDerivedFrom

A derivation is a transformation of an entity into another, an update of an entity resulting in a new one, or the construction of a new entity based on a pre-existing entity.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .

(7) Property: prov:startedAtTime ^{dp}

IRI: http://www.w3.org/ns/prov#startedAtTime

Start is when an activity is deemed to have been started by an entity, known as trigger. The activity did not exist before its start. Any usage, generation, or invalidation involving an activity follows the activity's start. A start may refer to a trigger entity that set off the activity, or to an activity, known as starter, that generated the trigger.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .

- prov:qualifiedAssociation op

PROV-DM term
  Association

---

(12) Property: prov:actedOnBehalfOf op

IRI: http://www.w3.org/ns/prov#actedOnBehalfOf

Delegation is the assignment of authority and responsibility to an agent (by itself or by another agent) to carry out a specific activity as a delegate or representative, while the agent it acts on behalf of retains some responsibility for the outcome of the delegated work. For example, a student acted on behalf of his supervisor, who acted on behalf of the department chair, who acted on behalf of the university; all those agents are responsible in some way for the activity that took place but we do not say explicitly who bears responsibility and to what degree.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix foaf: <http://xmlns.com/foaf/0.1/> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .
```

```
:derek
   a prov:Agent;
   foaf:givenName "Derek"^^xsd:string;
   foaf:mbox      <mailto:derek@example.org>;
   prov:actedOnBehalfOf :national_newspaper_inc;
.

:national_newspaper_inc
   a prov:Agent, prov:Organization;
   foaf:name "National Newspaper, Inc.";
.
```

An object property to express the accountability of an agent towards another agent. The subordinate agent acted on behalf of the responsible agent in an actual activity.

has super-properties

   Generation

---

(23) Property: prov:hadPrimarySource ^{op}

IRI: http://www.w3.org/ns/prov#hadPrimarySource

A primary source for a topic refers to something produced by some agent with direct experience and knowledge about the topic, at the time of the topic's study, without benefit from hindsight. Because of the directness of primary sources, they 'speak for themselves' in ways that cannot be captured through the filter of secondary sources. As such, it is important for secondary sources to reference those primary sources from which they were derived, so that their reliability can be investigated. A primary source relation is a particular case of derivation of secondary materials from their primary sources. It is recognized that the determination of primary sources can be up to interpretation, and should be done according to conventions accepted within the application's domain.

Example

```
@prefix rdfs:    <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:     <http://www.w3.org/2001/XMLSchema#> .

(30) Property: prov:wasStartedBy ^{op}

IRI:　http://www.w3.org/ns/prov#wasStartedBy

Start is when an activity is deemed to have been started by an entity, known as trigger. The activity did not exist before its start. Any usage, generation, or invalidation involving an activity follows the activity's start. A start may refer to a trigger entity that set off the activity, or to an activity, known as starter, that generated the trigger.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
```

```
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

# Use prov:qualifiedStart to see when and where the activity was started

:experiment
   a prov:Activity;
   prov:wasStartedBy :researcher;
.

:researcher a prov:Agent .
```

Start is when an activity is deemed to have started. A start may refer to an entity, known as trigger, that initiated the activity.

4.3 Qualified Terms

The terms used to qualify the Starting Point and Expanded properties are discussed in Section 3.3.

prov:Influence   prov:EntityInfluence   prov:Usage   prov:Start   prov:End   prov:Derivation   prov:PrimarySource   prov:Quotation
prov:Revision   prov:ActivityInfluence   prov:Generation   prov:Communication   prov:Invalidation   prov:AgentInfluence
prov:Attribution   prov:Association   prov:Plan   prov:Delegation   prov:InstantaneousEvent   prov:Role

prov:wasInfluencedBy   prov:qualifiedInfluence   prov:qualifiedGeneration   prov:qualifiedDerivation   prov:qualifiedPrimarySource
prov:qualifiedQuotation   prov:qualifiedRevision   prov:qualifiedAttribution   prov:qualifiedInvalidation   prov:qualifiedStart
prov:qualifiedUsage   prov:qualifiedCommunication   prov:qualifiedAssociation   prov:qualifiedEnd   prov:qualifiedDelegation
prov:influencer   prov:entity   prov:hadUsage   prov:hadGeneration   prov:activity   prov:agent   prov:hadPlan   prov:hadActivity
prov:atTime   prov:hadRole

(36) Class: prov:Influence
back to qualified classes

IRI: http://www.w3.org/ns/prov#Influence

Influence is the capacity of an entity, activity, or agent to have an effect on the character, development, or behavior of another by means of usage, start, end, generation, invalidation, communication, derivation, attribution, association, or delegation.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix my:   <http://example.com/ontology#> .
@prefix :     <http://example.com/> .

# Although a domain extension (e.g. ':wasConductedBy') is not defined by PROV-O,
# the relation between a surgery and an agent can still be qualified
# by reusing prov:Influence and one of its three subclasses
# (depending on the type of influencer):
# AgentInfluence, EntityInfluence, and ActivityInfluence.

my:wasConductedBy rdfs:subPropertyOf prov:wasAssociatedWith .

:conductingSurgery_1
  a prov:Activity;

  # This unqualified influence is unknown in PROV,
  # but would be a subproperty of wasAssociatedWith.
  my:wasConductedBy :bob;

  # Even though PROV systems do not understand my:wasConductedBy,
  prov:qualifiedAssociation [
    # they can recognize that the unknown relation
    # is being qualified with a prov:hadRole.
    a prov:Association,
      prov:AgentInfluence,   # Inferred
      prov:Influence;        # Inferred
    prov:agent  :bob;        # The object of my:wasConductedBy
    prov:hadRole my:surgeon;
  ];
.

:bob     a prov:Agent .
my:surgeon a prov:Role .
```

Because prov:Influence is a broad relation, its most specific subclasses (e.g. prov:Communication, prov:Delegation, prov:End, prov:Revision, etc.) should be used when applicable.

An instance of prov:Influence provides additional descriptions about the binary prov:wasInfluencedBy relation from some influenced Activity, Entity, or Agent to the influencing Activity, Entity, or Agent. For example, :stomach_ache prov:wasInfluencedBy :spoon; prov:qualifiedInfluence [a prov:Influence; prov:entity :spoon; :foo :bar] . Because prov:Influence is a broad relation, the more specific relations (Communication, Delegation, End, etc.) should be used when applicable.

@prefix :      <http://example.com/> .

:sortActivity
   a prov:Activity;
   prov:used :rawData;
   prov:qualifiedUsage [
      a prov:Usage,
        prov:EntityInfluence; ## Instances of Start, End, Usage, Derivation, and Invalidation
      prov:entity  :datasetA; ## qualify the influenced of an Entity (cited by prov:entity).
      prov:hadRole :inputToBeSorted;
   ];
   prov:generated :sortedData;
.

:rawData    a prov:Entity .
:sortedData a prov:Entity .
```

EntityInfluence provides additional descriptions of an Entity's binary influence upon any other kind of resource. Instances of EntityInfluence use the prov:entity property to cite the influencing Entity.

It is not recommended that the type EntityInfluence be asserted without also asserting one of its more specific subclasses.

is subclass of

prov:Influence

described with properties:

prov:entity ^{op}

prov:hadRole ^{op} , prov:influencer ^{op} , prov:hadActivity ^{op}

has subclasses

prov:End , prov:Start , prov:Usage , prov:Derivation

---

(38) Class: prov:Usage

back to qualified classes

IRI: http://www.w3.org/ns/prov#Usage

Usage is the beginning of utilizing an entity by an activity. Before usage, the activity had not begun to utilize this entity and could not have been affected by the entity.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :      <http://example.com/> .

:sortActivity
   a prov:Activity;
   prov:startedAtTime  "2011-07-16T01:52:02Z"^^xsd:dateTime;
   prov:qualifiedUsage [
      a prov:Usage;
      prov:entity    :datasetA;         ## The entity used by the prov:Usage
      prov:hadRole   :inputToBeSorted;  ## the role of the entity in this prov:Usage
   ];
   prov:generated :datasetB;
.

:datasetA        a prov:Entity .
:datasetB        a prov:Entity .
```

```
:inputToBeSorted a prov:Role .

## The role of :datasetA cannot be expressed using only starting-point terms:

:sortActivity
    a prov:Activity;
    prov:startedAtTime    "2011-07-16T01:52:02Z"^^xsd:dateTime;
    prov:used       :datasetA;
    prov:generated  :datasetB;
    .
```

An instance of prov:Usage provides additional descriptions about the binary prov:used relation from some prov:Activity to an prov:Entity that it used. For example, :keynote prov:used :podium; prov:qualifiedUsage [a prov:Usage; prov:entity :podium; :foo :bar].

is subclass of
> prov:InstantaneousEvent , prov:EntityInfluence

described with properties:

> prov:atTime [dp] , prov:entity [op]

in range of
> prov:hadUsage [op] prov:qualifiedUsage [op]

qualifies
> prov:used [op]

PROV-DM term
> Usage

---

(39) Class: prov:Start   back to qualified classes

IRI: http://www.w3.org/ns/prov#Start

Start is when an activity is deemed to have been started by an entity, known as trigger. The activity did not exist before its start. Any usage, generation, or invalidation involving an activity follows the activity's start. A start may refer to a trigger entity that set off the activity, or to an activity, known as starter, that generated the trigger.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

### Start can be used to qualify wasStartedBy with time and location information.
### In this example, a consistency checking activity is started by the update of a data record.

:consistency_checking
    a prov:Activity;
    prov:wasStartedBy :updated_data_record;
    prov:qualifiedStart [
        a prov:Start;
        prov:entity        :updated_data_record;
        prov:atTime        "2011-07-06T01:48:36Z"^^xsd:dateTime;
        prov:atLocation    :scienceLab_003;
        prov:hadActivity   :syntax_checking;
    ];
    .

:updated_data_record a prov:Entity .

### There is an explicit process of checking the syntax of the updated data record

:syntax_checking
    a   prov:Activity ;
    prov:startedAtTime    "2011-07-06T01:48:36Z"^^xsd:dateTime;
    prov:endedAtTime      "2011-07-06T02:12:36Z"^^xsd:dateTime;
    prov:wasAssociatedWith  :syntax_checker ;
    .

:syntax_checker   a   prov:SoftwareAgent .
```

An instance of prov:Start provides additional descriptions about the binary prov:wasStartedBy relation from some started prov:Activity to an prov:Entity that started it. For example, :foot_race prov:wasStartedBy :bang; prov:qualifiedStart [a prov:Start; prov:entity :bang; :foo :bar; prov:atTime '2012-03-09T08:05:08-05:00'^^xsd:dateTime] .

is subclass of
> prov:InstantaneousEvent , prov:EntityInfluence

described with properties:

> prov:hadActivity [op]

prov:atTime ^{dp} , prov:entity ^{op}

in range of

  prov:qualifiedStart ^{op}

qualifies

  prov:wasStartedBy ^{op}

PROV-DM term

  Start

---

(40) Class: prov:End

IRI: http://www.w3.org/ns/prov#End

End is when an activity is deemed to have been ended by an entity, known as trigger. The activity no longer exists after its end. Any usage, generation, or invalidation involving an activity precedes the activity's end. An end may refer to a trigger entity that terminated the activity, or to an activity, known as ender that generated the trigger.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

### End can be used to qualify wasEndedBy with time and location information.
### In this example, an experiment is stopped because an intermediate inconsitent resul.

:experiment
   a prov:Activity;
   prov:wasEndedBy :inconsistentResult;
   prov:qualifiedEnd [
      a prov:End;
      prov:entity      :inconsistentResult;
      prov:atTime       "2011-07-16T01:52:02Z"^^xsd:dateTime;
      prov:atLocation   :scienceLab_003;
      prov:hadActivity  :analyse_intermediate_result ;
   ];
.

:inconsistentResult a prov:Entity .

### An implicit process analyzes the intermediate result to confirm its expected consistency

analyse_intermediate_result
   a    prov:Activity ;
   prov:startedAtTime   "2011-07-15T12:52:02Z"^^xsd:dateTime;
   prov:endedAtTime     "2011-07-16T01:52:02Z"^^xsd:dateTime;
.
```

An instance of prov:End provides additional descriptions about the binary prov:wasEndedBy relation from some ended prov:Activity to an prov:Entity that ended it. For example, :ball_game prov:wasEndedBy :buzzer; prov:qualifiedEnd [a prov:End; prov:entity :buzzer; :foo :bar; prov:atTime '2012-03-09T08:05:08-05:00'^^xsd:dateTime].

is subclass of

  prov:InstantaneousEvent , prov:EntityInfluence

described with properties:

  prov:hadActivity ^{op}

  prov:atTime ^{dp} , prov:entity ^{op}

in range of

  prov:qualifiedEnd ^{op}

qualifies

  prov:wasEndedBy ^{op}

PROV-DM term

  End

---

(41) Class: prov:Derivation

IRI: http://www.w3.org/ns/prov#Derivation

A derivation is a transformation of an entity into another, an update of an entity resulting in a new one, or the construction of a new entity based on a pre-existing entity.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

# The simplest (and least detailed) form of derivation.
:bar_chart
   a prov:Entity;
   prov:wasDerivedFrom :aggregatedByRegions;
.

# The simple form can be accompanied by a qualified form:
# which provides more details about how :bar_chart was
# derived from :aggregatedRegions.

:bar_chart
   a prov:Entity;

   prov:wasDerivedFrom :aggregatedByRegions;
   prov:qualifiedDerivation [
      a prov:Derivation;
      prov:entity     :aggregatedByRegions;

      # Derivations can cite the influencing Activity in doing the derivation.
      prov:hadActivity  :create_the_chart;

      # They can also cite the Usage and Generation that the Activity
      # performed to generate :bar_chart.
      prov:hadUsage      :data_loading;
      prov:hadGeneration :plot_the_chart;
   ];
.

### The process during which the chart was created, from loading the data to the software, to process the data and plot the
### Additional metadata was recorded, like when it started (before the usage), ended (after the generation of the chart) and

:create_the_chart
   a prov:Activity;
   prov:wasAssociatedWith :derek;
   prov:startedAtTime "2012-04-03T00:00:00Z"^^xsd:dateTime;
   prov:endedAtTime "2012-04-03T00:00:10Z"^^xsd:dateTime;
.

### The final chart was plotted

:plot_the_chart
   a prov:Generation, prov:InstantaneousEvent;
   prov:atTime "2012-04-03T00:00:01Z"^^xsd:dateTime;
.

### The data was getting used to create the chart

:data_loading
   a prov:Usage;
   prov:atTime "2012-04-03T00:00:00Z"^^xsd:dateTime;
.
```

The more specific forms of prov:Derivation (i.e., prov:Revision, prov:Quotation, prov:PrimarySource) should be asserted if they apply.

An instance of prov:Derivation provides additional descriptions about the binary prov:wasDerivedFrom relation from some derived prov:Entity to another prov:Entity from which it was derived. For example, :chewed_bubble_gum prov:wasDerivedFrom :unwrapped_bubble_gum; prov:qualifiedDerivation [a prov:Derivation; prov:entity :unwrapped_bubble_gum; :foo :bar].

is subclass of
   prov:EntityInfluence

described with properties:

   prov:hadUsage op , prov:hadGeneration op

   prov:hadActivity op

   prov:entity op

in range of
   prov:qualifiedDerivation op

has subclasses
   prov:Revision , prov:PrimarySource , prov:Quotation

qualifies
   prov:wasDerivedFrom op

PROV-DM term
   Derivation

(42) Class: **prov:PrimarySource**   back to qualified classes

IRI:　http://www.w3.org/ns/prov#PrimarySource

A primary source for a topic refers to something produced by some agent with direct experience and knowledge about the topic, at the time of the topic's study, without benefit from hindsight. Because of the directness of primary sources, they 'speak for themselves' in ways that cannot be captured through the filter of secondary sources. As such, it is important for secondary sources to reference those primary sources from which they were derived, so that their reliability can be investigated. A primary source relation is a particular case of derivation of secondary materials from their primary sources. It is recognized that the determination of primary sources can be up to interpretation, and should be done according to conventions accepted within the application's domain.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:myPost
   a prov:Entity;
   prov:hadPrimarySource :donQuixote;
   prov:qualifiedPrimarySource [
      a prov:PrimarySource;
      prov:entity :donQuixote;
      :confidenceValue "6"^^xsd:integer;
      rdfs:comment """Not sure if Don Quixote was the original source,
                      so asserting a confidence value of 6 out of 10.""";
   ];
.

:donQuixote a prov:Entity.
```

An instance of prov:PrimarySource provides additional descriptions about the binary prov:hadPrimarySource relation from some secondary prov:Entity to an earlier, primary prov:Entity. For example, :blog prov:hadPrimarySource :newsArticle; prov:qualifiedPrimarySource [a prov:PrimarySource; prov:entity :newsArticle; :foo :bar] .

is subclass of
　　prov:Derivation

described with properties:

　　prov:hadGeneration [op] , prov:hadUsage [op]

in range of
　　prov:qualifiedPrimarySource [op]

qualifies
　　prov:hadPrimarySource [op]

PROV-DM term
　　primary-source

---

(43) Class: prov:Quotation　　　　　　　　　　　　　　　　　　　back to qualified classes

IRI:　http://www.w3.org/ns/prov#Quotation

A quotation is the repeat of (some or all of) an entity, such as text or image, by someone who may or may not be its original author. Quotation is a particular case of derivation.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix ex:   <http://example.com/vocab#> .
@prefix :     <http://example.com/> .

:dagstuhl-quote
   a prov:Entity;
   prov:value   "why would people record and share provenance in the first place?";
   prov:wasQuotedFrom <http://purl.org/twc/page/thoughts-from-the-dagstuhl-workshop>;
   prov:qualifiedQuotation [
      a prov:Quotation;
      prov:entity    <http://purl.org/twc/page/thoughts-from-the-dagstuhl-workshop>;
      ex:fromSection 2;
   ];
   prov:wasAttributedTo <http://data.semanticweb.org/person/luc-moreau>;
.

<http://purl.org/twc/page/thoughts-from-the-dagstuhl-workshop>
   a prov:Entity;
   prov:wasAttributedTo <http://data.semanticweb.org/person/paul-groth>;
.
```

```
<http://data.semanticweb.org/person/luc-moreau> a prov:Person, prov:Agent .
<http://data.semanticweb.org/person/paul-groth> a prov:Person, prov:Agent .
```

An instance of prov:Quotation provides additional descriptions about the binary prov:wasQuotedFrom relation from some taken prov:Entity from an earlier, larger prov:Entity. For example, :here_is_looking_at_you_kid prov:wasQuotedFrom :casablanca_script; prov:qualifiedQuotation [a prov:Quotation; prov:entity :casablanca_script; :foo :bar].

is subclass of
 prov:Derivation

described with properties:

 prov:hadGeneration ^{op} , prov:hadUsage ^{op}

in range of
 prov:qualifiedQuotation ^{op}

qualifies
 prov:wasQuotedFrom ^{op}

PROV-DM term
 quotation

---

(44) Class: prov:Revision

back to qualified classes

IRI: http://www.w3.org/ns/prov#Revision

A revision is a derivation for which the resulting entity is a revised version of some original. The implication here is that the resulting entity contains substantial content from the original. Revision is a particular case of derivation.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix ex:   <http://example.com/vocab#> .
@prefix :     <http://example.com/> .

:draft2
   a prov:Entity;
   prov:wasRevisionOf   :draft1;
   prov:qualifiedRevision [
      a prov:Revision;
      prov:entity        :draft1;
      ex:peerReviewed     false;
   ];

   prov:wasAssociatedWith :edward;
   prov:qualifiedAssociation [
      a prov:Association;
      prov:agent         :edward;
      prov:hadRole       :editor;
   ];
.

:draft1 a prov:Entity .

:edward
   a prov:Person, prov:Agent;
.
```

An instance of prov:Revision provides additional descriptions about the binary prov:wasRevisionOf relation from some newer prov:Entity to an earlier prov:Entity. For example, :draft_2 prov:wasRevisionOf :draft_1; prov:qualifiedRevision [a prov:Revision; prov:entity :draft_1; :foo :bar].

is subclass of
 prov:Derivation

described with properties:

in range of
 prov:qualifiedRevision ^{op}

qualifies
 prov:wasRevisionOf ^{op}

PROV-DM term
 revision

---

(45) Class: prov:ActivityInfluence

IRI: http://www.w3.org/ns/prov#ActivityInfluence

ActivitiyInfluence is the capacity of an activity to have an effect on the character, development, or behavior of another by means of generation, invalidation, communication, or other.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :      <http://example.com/> .

:bar_chart
    a prov:Entity;
    prov:wasGeneratedBy      :illustrating;
    prov:qualifiedGeneration :making-bar-chart;
.

:making-bar-chart
    a prov:Generation,
      prov:ActivityInfluence;  ## Instances of Generation, Invalidation and Communication qualify
    prov:activity :illustrating; ## the influence of an Activity (cited by prov:activity)
    rdfs:comment "Ended up with bar chart as line chart looked ugly."@en;
.

:illustrating a prov:Activity .
```

It is not recommended that the type ActivityInfluence be asserted without also asserting one of its more specific subclasses.

ActivityInfluence provides additional descriptions of an Activity's binary influence upon any other kind of resource. Instances of ActivityInfluence use the prov:activity property to cite the influencing Activity.

is subclass of
   prov:Influence

described with properties:

   prov:activity ^{op}

   prov:hadRole ^{op} , prov:influencer ^{op} , prov:hadActivity ^{op}

has subclasses
   prov:Generation , prov:Invalidation , prov:Communication

(46) Class: prov:Generation

IRI: http://www.w3.org/ns/prov#Generation

Generation is the completion of production of a new entity by an activity. This entity did not exist before generation and becomes available for usage after this generation.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix bbc:  <http://www.bbc.co.uk/> .
@prefix eg:   <http://example.com/vocab#> .
@prefix :      <http://example.com/> .

:bbcNews2012-04-03
    a prov:Entity, eg:DailyNews;
    rdfs:comment """The BBC news home page on 2012-04-03 contained a reference
                    to a given news item, but the BBC news home page on
                    the next day did not.""";

    prov:wasGeneratedBy :publishingActivity;
    prov:qualifiedGeneration [
       a prov:Generation, prov:InstantaneousEvent;
       prov:atTime "2012-04-03T00:00:01Z"^^xsd:dateTime;
       prov:activity :publishingActivity;
    ];
    prov:qualifiedInvalidation [
       a prov:Invalidation, prov:InstantaneousEvent;
       prov:atTime "2012-04-03T23:59:59Z"^^xsd:dateTime;
    ];
.

:publishingActivity
    a prov:Activity;
.
```

An instance of prov:Generation provides additional descriptions about the binary prov:wasGeneratedBy relation from a generated prov:Entity to the prov:Activity that generated it. For example, :cake prov:wasGeneratedBy :baking; prov:qualifiedGeneration [a prov:Generation; prov:activity :baking; :foo :bar].

is subclass of
> prov:InstantaneousEvent , prov:ActivityInfluence

described with properties:

> prov:activity ^{op} , prov:atTime ^{dp}

in range of
> prov:hadGeneration ^{op} prov:qualifiedGeneration ^{op}

qualifies
> prov:wasGeneratedBy ^{op}

PROV-DM term
> Generation

---

(47) Class: prov:Communication   back to qualified classes

IRI: http://www.w3.org/ns/prov#Communication

Communication is the exchange of an entity by two activities, one activity using the entity generated by the other.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix ex:   <http://example.com/vocab#> .
@prefix :     <http://example.com/> .

:writing-celebrity-gossip
   a prov:Activity;
   prov:wasInformedBy          :voicemail-interception;
   prov:qualifiedCommunication :informing-the-journalist;
.

:informing-the-journalist
   a prov:Communication;
   prov:activity   :voicemail-interception;
   ex:mediaType "email";
.

:voicemail-interception a prov:Activity .
```

An instance of prov:Communication provides additional descriptions about the binary prov:wasInformedBy relation from an informed prov:Activity to the prov:Activity that informed it. For example, :you_jumping_off_bridge prov:wasInformedBy :everyone_else_jumping_off_bridge; prov:qualifiedCommunication [a prov:Communication; prov:activity :everyone_else_jumping_off_bridge; :foo :bar].

is subclass of
> prov:ActivityInfluence

described with properties:

> prov:activity ^{op}

in range of
> prov:qualifiedCommunication ^{op}

qualifies
> prov:wasInformedBy ^{op}

PROV-DM term
> Communication

---

(48) Class: prov:Invalidation   back to qualified classes

IRI: http://www.w3.org/ns/prov#Invalidation

Invalidation is the start of the destruction, cessation, or expiry of an existing entity by an activity. The entity is no longer available for use (or further invalidation) after invalidation. Any generation or usage of an entity precedes its invalidation.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix wgs:  <http://www.w3.org/2003/01/geo/wgs84_pos#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix foaf: <http://xmlns.com/foaf/0.1/> .
@prefix :     <http://example.com/> .

:the-Painter
   a prov:Entity, :Painting;
   rdfs:label "Le Peintre"@fr, "The Painter"@en;

(49) Class: prov:AgentInfluence   back to qualified classes

IRI: http://www.w3.org/ns/prov#AgentInfluence

AgentInfluence is the capacity of an agent to have an effect on the character, development, or behavior of another by means of attribution, association, delegation, or other.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:illustrating
   a prov:Activity;
   prov:wasAssociatedWith :derek;
   prov:qualifiedAssociation [
      a prov:Association,
        prov:AgentInfluence; ## Instances of Generation, Invalidation and Communication qualify
      prov:agent   :derek;   ## the influence of an Agent (cited by prov:agent)
      prov:hadRole :illustrationist
   ];
.
:derek a prov:Person, prov:Agent, prov:Entity .

:illustratonist a prov:Role .
```

AgentInfluence provides additional descriptions of an Agent's binary influence upon any other kind of resource. Instances of AgentInfluence use the prov:agent property to cite the influencing Agent.

It is not recommended that the type AgentInfluence be asserted without also asserting one of its more specific subclasses.

is subclass of
    prov:Influence

described with properties:

    prov:agent ^{op}

    prov:hadRole ^{op} , prov:influencer ^{op} , prov:hadActivity ^{op}

has subclasses
    prov:Delegation , prov:Association , prov:Attribution

---

(50) Class: prov:Attribution

IRI: http://www.w3.org/ns/prov#Attribution

Attribution is the ascribing of an entity to an agent. When an entity e is attributed to agent ag, entity e was generated by some unspecified activity that in turn was associated to agent ag. Thus, this relation is useful when the activity is not known, or irrelevant.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix ex:   <http://example.com/vocab#> .
@prefix :     <http://example.com/> .

<http://dbpedia.org/resource/Fallingwater>
   a prov:Entity;
   prov:wasAttributedTo <http://dbpedia.org/resource/Edgar_J._Kaufmann>,
                        <http://dbpedia.org/resource/Frank_Lloyd_Wright>,
                        :western-Pennsylvania-Conservancy;
   prov:qualifiedAttribution [
      a prov:Attribution;

qualifies
    prov:wasAttributedTo ^{op}

PROV-DM term
    attribution

---

(51) Class: prov:Association

IRI: http://www.w3.org/ns/prov#Association

An activity association is an assignment of responsibility to an agent for an activity, indicating that the agent had a role in the activity. It further allows for a plan to be specified, which is the plan intended by the agent to achieve some goals in the context of this activity.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:illustrating
    a prov:Activity;
    prov:wasAssociatedWith :derek,
                           :steve;
    prov:qualifiedAssociation [
        a prov:Association;
        prov:agent   :derek;
        prov:hadRole :illustrationist;
    ];
    prov:qualifiedAssociation [
        a prov:Association;
        prov:agent   :steve;
        prov:hadRole :stylist;
        prov:hadPlan :style-guide;
        rdfs:comment "Steve helped Derek conform with the publisher's style guide."@en;
    ];
.

:derek a prov:Person, prov:Agent, prov:Entity .
:steve a prov:Person, prov:Agent, prov:Entity .

:illustratonist a prov:Role .
:stylist        a prov:Role .

:style-guide a prov:Plan, prov:Entity .
```

An instance of prov:Association provides additional descriptions about the binary prov:wasAssociatedWith relation from an prov:Activity to some prov:Agent that had some responsiblity for it. For example, :baking prov:wasAssociatedWith :baker; prov:qualifiedAssociation [a prov:Association; prov:agent :baker; :foo :bar].

is subclass of
     prov:AgentInfluence

described with properties:

     prov:hadPlan [op]

     prov:hadRole [op]

     prov:agent [op]

in range of
     prov:qualifiedAssociation [op]

qualifies
     prov:wasAssociatedWith [op]

PROV-DM term
     Association

---

(52) Class: prov:Plan   back to qualified classes

IRI: http://www.w3.org/ns/prov#Plan

A plan is an entity that represents a set of actions or steps intended by one or more agents to achieve some goals.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:illustrating
    a prov:Activity;
    prov:qualifiedAssociation :steve-checking-style-guide;
.

:steve-checking-style-guide
    a prov:Association;
    prov:agent   :steve;
    prov:hadPlan :style-guide;
```

```
    rdfs:comment "Steve followed the publisher's style guide"@en;
.

:style-guide
   a prov:Plan, prov:Entity;
   rdfs:comment "Use blue graphs for positive spin, red for negative"@en;
.
```

There exist no prescriptive requirement on the nature of plans, their representation, the actions or steps they consist of, or their intended goals. Since plans may evolve over time, it may become necessary to track their provenance, so plans themselves are entities. Representing the plan explicitly in the provenance can be useful for various tasks: for example, to validate the execution as represented in the provenance record, to manage expectation failures, or to provide explanations.

is subclass of
> prov:Entity

in range of
> prov:hadPlan ^{op}

PROV-DM term
> Association

---

(53) Class: prov:Delegation   back to qualified classes

IRI: http://www.w3.org/ns/prov#Delegation

Delegation is the assignment of authority and responsibility to an agent (by itself or by another agent) to carry out a specific activity as a delegate or representative, while the agent it acts on behalf of retains some responsibility for the outcome of the delegated work. For example, a student acted on behalf of his supervisor, who acted on behalf of the department chair, who acted on behalf of the university; all those agents are responsible in some way for the activity that took place but we do not say explicitly who bears responsibility and to what degree.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix ex:   <http://example.com/vocab#> .
@prefix :     <http://example.com/> .

### In this example, Frank (an insurance agent) acts on behalf of his company for performing
### a policy sale

:policySale
   a prov:Activity;
   prov:wasAssociatedWith :insuranceAgent_Frank;
.

:insuranceAgent_Frank
   a prov:Person;
   prov:actedOnBehalfOf :insuranceCompany_A;
   prov:qualifiedDelegation [
      a prov:Delegation;
      prov:agent        :insuranceCompany_A;
      ex:rewardScheme   "commission";
      prov:hadActivity  :policySale ;
   ];
.
```

An instance of prov:Delegation provides additional descriptions about the binary prov:actedOnBehalfOf relation from a performing prov:Agent to some prov:Agent for whom it was performed. For example, :mixing prov:wasAssociatedWith :toddler . :toddler prov:actedOnBehalfOf :mother; prov:qualifiedDelegation [a prov:Delegation; prov:entity :mother; :foo :bar].

is subclass of
> prov:AgentInfluence

described with properties:

> prov:hadActivity ^{op}

---

(54) Class: prov:InstantaneousEvent

IRI: http://www.w3.org/ns/prov#InstantaneousEvent

The PROV data model is implicitly based on a notion of instantaneous events (or just events), that mark transitions in the world. Events include generation, usage, or invalidation of entities, as well as starting or ending of activities. This notion of event is not first-class in the data model, but it is useful for explaining its other concepts and its semantics.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix bbc:  <http://www.bbc.co.uk/> .
@prefix :     <http://example.com/> .

:bbcNews2012-04-03
   a prov:Entity, :DailyNews;
   rdfs:comment """The BBC news home page on 2012-04-03 contained
                   a reference to a given news item, but the BBC news
                   home page on the next day did not.""";

   prov:qualifiedGeneration [

      prov:atTime "2012-04-03T23:59:59Z"^^xsd:dateTime;
   ];
   .
```

An instantaneous event, or event for short, happens in the world and marks a change in the world, in its activities and in its entities. The term 'event' is commonly used in process algebra with a similar meaning. Events represent communications or interactions; they are assumed to be atomic and instantaneous.

described with properties:

prov:atTime ᵈᵖ

  Derivation

---

(60) Property: prov:qualifiedPrimarySource ^{op}

IRI: http://www.w3.org/ns/prov#qualifiedPrimarySource

A primary source for a topic refers to something produced by some agent with direct experience and knowledge about the topic, at the time of the topic's study, without benefit from hindsight. Because of the directness of primary sources, they 'speak for themselves' in ways that cannot be captured through the filter of secondary sources. As such, it is important for secondary sources to reference those primary sources from which they were derived, so that their reliability can be investigated. A primary source relation is a particular case of derivation of secondary materials from their primary sources. It is recognized that the determination of primary sources can be up to interpretation, and should be done according to conventions accepted within the application's domain.

Example

```
@prefix rdfs:    <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:     <http://www.w3.org/2001/XMLSchema#> .

(62) Property: prov:qualifiedRevision ^{op}

back to qualified properties

IRI: http://www.w3.org/ns/prov#qualifiedRevision

A revision is a derivation for which the resulting entity is a revised version of some original. The implication here is that the resulting entity contains substantial content from the original. Revision is a particular case of derivation.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:draft2
   a prov:Entity;
   prov:wasRevisionOf :draft1;

(63) Property: prov:qualifiedAttribution ^{op}   back to qualified properties

IRI: http://www.w3.org/ns/prov#qualifiedAttribution

Attribution is the ascribing of an entity to an agent. When an entity e is attributed to agent ag, entity e was generated by some unspecified activity that in turn was associated to agent ag. Thus, this relation is useful when the activity is not known, or irrelevant.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix ex:   <http://example.com/vocab#> .
@prefix :     <http://example.com/> .

## When the role of the agent is not known or does not matter:

:nationalRegionsList
    a prov:Entity;
    prov:wasAttributedTo :civil_action_group;
.

:civil_action_group a prov:Agent .

## If we want to express the role of the agent:

:nationalRegionsList

---

(70) Property: prov:qualifiedDelegation ^{op}

IRI: http://www.w3.org/ns/prov#qualifiedDelegation

Delegation is the assignment of authority and responsibility to an agent (by itself or by another agent) to carry out a specific activity as a delegate or representative, while the agent it acts on behalf of retains some responsibility for the outcome of the delegated work. For example, a student acted on behalf of his supervisor, who acted on behalf of the department chair, who acted on behalf of the university; all those agents are responsible in some way for the activity that took place but we do not say explicitly who bears responsibility and to what degree.

Example

```

has range

  • prov:Plan

PROV-DM term

    Association

---

(78) Property: prov:hadActivity op   back to qualified properties

IRI: http://www.w3.org/ns/prov#hadActivity

An activity is something that occurs over a period of time and acts upon or with entities; it may include consuming, processing, transforming, modifying, relocating, using, or generating entities.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

# The activity that which used, generated, invalidated
# or was responsible for the entity. In this qualified Derivation
# prov:hadActivity references the activity that generated the bar chart.

:bar_chart
   a prov:Entity;
   prov:wasDerivedFrom :aggregatedByRegions;
```

```
      prov:wasGeneratedBy :make_bar_chart;
      prov:qualifiedDerivation [
        a prov:Derivation;
        prov:entity      :aggregatedByRegions;
        prov:hadActivity :make_bar_chart; # references same activity as prov:wasGeneratedBy
      ];
    .

    :aggregatedByRegions a prov:Entity .
    :make_bar_chart      a prov:Activity .
```

The _optional_ Activity of an Influence, which used, generated, invalidated, or was the responsibility of some Entity. This property is _not_ used by ActivityInfluence (use prov:activity instead).

This property has multiple RDFS domains to suit multiple OWL Profiles. See [PROV-O OWL Profile](#).

has domain
- [prov:Delegation](#) or [prov:Derivation](#) or [prov:End](#) or [prov:Start](#)
- [prov:Influence](#)

has range
- [prov:Activity](#)

PROV-DM term
[Activity](#)

---

(79) Property: [prov:atTime](#) dp

IRI: http://www.w3.org/ns/prov#atTime

The PROV data model is implicitly based on a notion of instantaneous events (or just events), that mark transitions in the world. Events include generation, usage, or invalidation of entities, as well as starting or ending of activities. This notion of event is not first-class in the data model, but it is useful for explaining its other concepts and its semantics.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:Timearticle20120430_publication
   a prov:InstantaneousEvent;
   prov:atTime "2012-04-30T20:40:40"^^xsd:dateTime;
 .
```

The time at which an InstantaneousEvent occurred, in the form of xsd:dateTime.

has domain
- [prov:InstantaneousEvent](#)

has range
- http://www.w3.org/2001/XMLSchema#dateTime

qualifies

[prov:invalidatedAtTime](#) dp

---

(80) Property: [prov:hadRole](#) op

IRI: http://www.w3.org/ns/prov#hadRole

A role is the function of an entity or agent with respect to an activity, in the context of a usage, generation, invalidation, association, start, and end.

Example

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix xsd:  <http://www.w3.org/2001/XMLSchema#> .
@prefix owl:  <http://www.w3.org/2002/07/owl#> .
@prefix prov: <http://www.w3.org/ns/prov#> .
@prefix :     <http://example.com/> .

:divideActivity
   a prov:Activity;

   prov:used        :variableA;
   prov:qualifiedUsage [
     a prov:Usage;
     prov:entity    :variableA;
```

```
        prov:hadRole   :dividend;
    ];

    prov:used         :variableB;
    prov:qualifiedUsage [
        a prov:Usage;
        prov:entity    :variableB;
        prov:hadRole   :divisor;
    ];
    .

:variableA a prov:Entity .
:variableB a prov:Entity .

:dividend a prov:Role .
:divisor  a prov:Role .
```

The _optional_ Role that an Entity assumed in the context of an Activity. For example, :baking prov:used :spoon; prov:qualified [a prov:Usage; prov:entity :spoon; prov:hadRole roles:mixing_implement].

This property has multiple RDFS domains to suit multiple OWL Profiles. See PROV-O OWL Profile.

A. PROV-O OWL Profile

This section is non-normative.

To encourage widespread adoption, PROV-O's design is intentionally minimal and lightweight. Because the OWL 2 RL profile is aimed at RDF applications that require scalable reasoning without sacrificing too much expressive power [*OWL2-PRIMER*], it served as a baseline for all axioms included in PROV-O. The PROV-O axioms that do not suit the OWL 2 RL profile are listed in Table 5. All five use an anonymous *class union* for the domain or range of a property, while OWL 2 RL requires the classes to be explicitly named. Although introducing "placeholder" classes would have suited the OWL 2 RL profile, these additional "abstract" classes would have been irrelevant to the modeling of provenance information, increased the size of PROV-O unnecessarily, and exposed a potential to confuse users. All five axioms listed in the following table *use a non-superclass expression in a position that requires a superclass expression* and do not conform to the OWL 2 RL Profile.

Table 5: All OWL Axioms in PROV-O that do not conform to the OWL-RL profile.

Non OWL-RL PROV-O Axiom
`prov:atLocation` rdfs:domain `[ owl:unionOf (prov:Activity prov:Agent prov:Entity prov:InstantaneousEvent) ]`
`prov:wasInfluencedBy` rdfs:domain `[ owl:unionOf (prov:Activity prov:Agent prov:Entity) ]`
`prov:wasInfluencedBy` rdfs:range `[ owl:unionOf (prov:Activity prov:Agent prov:Entity) ]`
`prov:hadActivity` rdfs:domain `[ owl:unionOf (prov:Delegation prov:Derivation prov:Start prov:End) ]`
`prov:hadRole` rdfs:domain `[ owl:unionOf (prov:Association prov:InstantaneousEvent) ]`

To provide guidance for OWL 2 RL environments that ignore the union domain axioms, some property domains or ranges have also been defined with the closest common superclass for the classes in the union, as shown in the following table.

Table 6: Intersecting OWL2 RL compatible domains/ranges

Property	Direction	Domain/range
`prov:atLocation`	rdfs:domain	(implied: `owl:Thing`)
`prov:wasInfluencedBy`	rdfs:domain / rdfs:range	(implied: `owl:Thing`)
`prov:hadActivity`	rdfs:domain	`prov:Influence`
`prov:hadRole`	rdfs:domain	`prov:Influence`

Multiple RDFS domains and ranges [*RDF-SCHEMA*] for a property are interpreted as an intersection, and thus the above do not provide any additional information in an OWL 2 DL or OWL 2 Full profile, which also understands the unions. The more general domain should not be interpreted as saying, e.g., "prov:hadActivity can be used with any prov:Influence", but as "Anything using prov:hadActivity is (at least) a prov:Influence".

B. Names of inverse properties

To maximize interoperability, PROV-O intentionally avoids defining too many properties' inverses. In fact, it only defines two (`prov:generated` and `prov:invalidated`). When all inverses are defined for all properties, modelers may choose from two logically equivalent properties when making each assertion. Although the two options may be logically equivalent, developers consuming the assertions may need to exert extra effort to handle both (e.g., by either adding an OWL reasoner or writing code and queries to handle both cases). This extra effort can be reduced by preferring one inverse over another.

For example, the first PROV-O statement (below) could just as easily be asserted as the second statement. But if a client queries using `prov:wasDerivedFrom` when `:hadDerivation` was used in the assertion, no results will be returned unless OWL reasoning is applied (or the size of the query is doubled).

```
Example

<http://www.w3.org/TR/prov-o/>  prov:wasDerivedFrom <http://www.w3.org/TR/prov-dm/> .
    # These two statements are equivalent if prov:wasDerivedFrom is an inverse of :hadDerivation.
```

```
    # But extra effort is required to handle both cases (if one is not already using OWL reasoning).
    # We cannot assume that everybody is using OWL reasoning.
    # We do not want people to write more code and query than necessary.

    <http://www.w3.org/TR/prov-dm/>      :hadDerivation <http://www.w3.org/TR/prov-o/> .
```

So, PROV-O avoids this situation by encouraging modelers to use one property instead of its inverse; the preferred property to use is the one defined in the PROV-O ontology. Those asserting and querying for the preferred property avoid the need for OWL reasoning, additional code, and larger queries while maintaining the same level of interoperability.

However, the **absence** of defined inverses can lead to a **different** risk to interoperability. Because modelers are free to create their own properties to suit their needs, they may be motivated to assert the inverse of any PROV-O property defined herein.

For example, since PROV-O does not define the inverse of prov:wasDerivedFrom, and if three developers would rather model their assertions in the opposite direction, the following set of assertions might be found in the future web of provenance. These assertions are not in an interoperable form without the use of an OWL reasoner, additional code, or larger queries.

```
Example

    # If PROV-O's properties' inverses are not defined, modelers may be motivated to introduce their own inverse property name.
    # The following three statements are equivalent if their predicates are all inverses of prov:wasDerivedFrom.

    <http://www.w3.org/TR/prov-dm/>    my:hadDerivation <http://www.w3.org/TR/prov-o/> .
    <http://www.w3.org/TR/prov-dm/>  your:ledTo        <http://www.w3.org/TR/prov-o/> .
    <http://www.w3.org/TR/prov-dm/> their:derivedTo    <http://www.w3.org/TR/prov-o/> .
```

To balance these two interoperability risks, this document reserves the names of the PROV-O inverses. The name of a property's inverse is determined by appending the value of its http://www.w3.org/ns/prov#inverse annotation to the PROV namespace (http://www.w3.org/ns/prov#). Modelers wishing to use inverses of the properties defined by PROV-O SHOULD use those reserved by this document.

For example, the same three modelers above that defined my:hadDerivation, your:ledTo, and their:derivedTo should instead look for the http://www.w3.org/ns/prov#inverse annotation on prov:wasDerivedFrom to determine that they should use the property http://www.w3.org/ns/prov#hadDerivation.

```
Example

    @prefix prov: <http://www.w3.org/ns/prov#> .

    # Each PROV-O property is annotated with the local name of its inverse.

    prov:wasDerivedFrom
       a owl:ObjectProperty;
       rdfs:isDefinedBy <http://www.w3.org/ns/prov#>;
       prov:inverse    "hadDerivation";
       rdfs:domain  prov:Entity;
       rdfs:range   prov:Entity;
    .

    # Instead of defining their own, modelers should use the
    # recommended inverse local name within the PROV namespace:

    <http://www.w3.org/TR/prov-dm/> prov:hadDerivation <http://www.w3.org/TR/prov-o/>  .

    # Following this recommendation avoids a proliferation of inverse definitions,
    # while encouraging the use of one inverse over another.
    # This increases interoperability.
```

The following table lists the recommended inverse names that should be used if a modeler does not want to use the recommended PROV-O property. For convenience, this file lists the resulting inverse properties.

Table 5: Names of inverses

Domain	PROV-O Property	Recommended inverse name	Range

C. Changes since WD-prov-o-20120724

This section is non-normative.

- Restated `prov:hadRole`'s domain to 'Association or InstantaneousEvent' instead of the original that enumerated the subclasses of InstantaneousEvent ('Association or End or Generation or Invalidation or Start or Usage').
- Renamed prov:Source to `prov:PrimarySource` and prov:qualifiedSource to `prov:qualifiedPrimarySource`.
- Examples have been rewritten to avoid usage of TriG named graph syntax except for when showing bundles in prov:asInBundle and prov:mentionOf (since removed to a separate Note). A citation to TriG was added.
- Some examples have been elaborated to use resource names like `:illustration_usage` rather than `:usage_1`.
- Fixed naming mismatch by changing prov:hadOriginalSource to `prov:hadPrimarySource`.
- Rephrased definitions for `prov:EntityInfluence`, `prov:ActivityInfluence`, and `prov:AgentInfluence` to align with the definition of their superclass `prov:Influence`.
- Updated definitions for `prov:Start` and `prov:End` from PROV-DM.
- The property chain for `prov:wasInformedBy` was fixed from "qualifiedCommunication o entity subproperty of wasInformedBy" to "`prov:qualifiedCommunication` o `prov:activity` subproperty of wasInformedBy"
- Removed prov:mentionOf and prov:asInBundle, which have been relocated to its own Note.
- Added comments encouraging the use of the more specific forms of `prov:Influence`.
- Added uniform references to other "dated" PROV documents.
- Added prefix namespace table.
- Added Compliance with this document section.
- Corrected Turtle syntax for RL violations in PROV-O OWL Profile section. They were missing owl:unionOf.
- Updated attributions for the tools used to produce this document in Acknowledgements section.
- Reworked the Expanded Terms narrative and examples to better highlight each term.

D. Changes since CR-prov-o-20121211

This section is non-normative.

- Updated exemplar in cross reference entry <u>prov:hadGeneration</u> to include <u>prov:activity</u> property.
- Reordered class and predicate terms from alphabetical to a more natural narrative-based order.
- Added <u>Term Index</u> to aid reading this document in printed form.
- Fixed typo 'iteself' to 'itself'.
- Removed inaccurate property characteristics (AsymmetricProperty, IrreflexiveProperty) in third example of <u>Appendix B</u>.
- Added note to <u>Starting Point Terms</u> stating that rdf:type and rdfs:label are used to express PROV-DM's prov:type and prov:label.
- Updated prov:value's out-of-date definition to conform to PROV-DM's (i.e., "Provides a value that is a direct representation of an entity.".
- Updated prov:wasDerivedFrom's out-of-date definition to conform to PROV-DM's (i.e., "A derivation is a transformation of an entity into another, an update of an entity resulting in a new one, or the construction of a new entity based on a pre-existing entity.".
- Added xsd:dateType datatypes to exemplar in Invalidation and invalidatedAtTime.
- Fixed some incorrect wasAttributedTo/wasAssociatedWith in the cross reference exemplars.
- Changed the status of this document section: added new documents to the PROV Family of Document, and removed the how to read section, referring instead to PROV-OVERVIEW.
- Changed all URLs to PROV documents.

E. Changes since PR-prov-o-20130312

This section is non-normative.

- Fixed typo in <u>alternateOf</u> example: `:london_forecast_043` became `:london_forecast_0413`
- Changed capitalization in definitions for <u>Organization</u> (<u>new</u>) and <u>Person</u> (<u>new</u>).

F. Acknowledgements
